What is the value of SQLAlchemy?

The value of SQLAlchemy is that it allows application developers the ability to use SQL within a Python abstraction. Essentially, it provides an interface between python programming and interaction with databases.

What is a model?

A model is an abstraction that allows you to interact with and execute SQL commands indirectly.

What is a view?

A view allows you to peek under the hood at the models, and allows you to create, delete, update, or read the models.
